880V

880V/LF880V/LF886V Series

Installation Instructions • Instructions de installation • Instructions d'installation

IS-F-880V-RP/PDA

Read this Manual BEFORE using this equipment.
Failure to read and follow all safety and use information can result in death, serious personal injury, property damage, or damage to the equipment.
Keep this Manual for future reference.

Need for Periodic Inspection/Maintenance: This product must be tested periodically in compliance with local codes, but at least once per year or more as service conditions warrant. All products must be retested once maintenance has been performed. Corrosive water conditions and/or unauthorized adjustments or repair could render the product ineffective for the service intended. Regular checking and cleaning of the product's internal components helps assure maximum life and proper product function.

Local building or plumbing codes may require modifications to the information provided. You are required to consult the local building and plumbing codes prior to installation. If the information provided here is not consistent with local building or plumbing codes, the local codes should be followed. This product must be installed by a licensed contractor in accordance with local codes and ordinances.

The flange gasket bolts for the gate valves should be retightened during installation as the bolts may have loosened due to storage and shipping.

Installation Instructions

1. It is recommended that system supply pressure be at least 20psi (138 kPa).
2. These instructions apply to Series 880V/LF880V/LF886V sizes 2½" to 10" (65-250mm) only. The valve may be installed only in the orientation/flow direction as shown. The gate valves may be rotated as permitted by the flange bolt pattern.

Normal discharge and nuisance spitting are accommodated by use of a FEBCO air gap fitting and a fabricated indirect waste line. The gap drain is not designed to catch the maximum discharge possible from the relief valve. The installation of FEBCO air gap with the drain line terminating above a floor drain will handle any normal discharge or nuisance spitting through the relief valve. However, floor drain size may need to be designed to prevent water damage caused by a catastrophic failure condition. Do not reduce the size of the drain line from the air gap fitting.

3. The valve assembly must be installed where it is accessible for periodic testing and

maintenance. Clearances shown in the installation views apply to exterior, interior and pit/vault installations and are only recommendations. These minimums do not apply to removable protective enclosures. Refer to local codes for actual requirements in your area.

4. PRIOR TO INSTALLING THE VALVE INTO THE LINE, FLUSH THE SUPPLY LINE OF ALL FOREIGN MATERIAL. Failure to flush the supply line may cause the check valves to become fouled and require disassembly and cleaning.
5. Lift the assembly by connecting lift hooks to the lift rings cast into the valve body. DO NOT LIFT THE ASSEMBLY BY CONNECTING TO THE GATE VALVE HANDWHEELS OR STEMS. The use of the optional valve setters (horizontal units only) provides for a rigid connection to the supply line (with the correct centerline) without the need for concrete thrust blocks.
6. For vertical installation, loosen bolts on the groove coupling just enough to allow rotation of the outlet check. Rotate the outlet check 180°. Install pipe support (pipe support to be furnished by customer and shall fit same size pipe as the valve being installed, except 2½" (65mm) valves will use a 3" pipe support).

7. After installation SLOWLY fill the assembly with water and bleed air from the body using the # 3 and # 4 test cocks. Test the valve assembly to ensure correct operation.

All assemblies are tested at the factory for proper operation and leakage. If the valve does not pass the field test, it is most likely due to a fouled check valve. This is not covered by the factory warranty. The valve cover(s) must be removed and the check seats inspected and cleaned. Any damage or improper operation caused by pipeline debris or improper installation/start-up is not included in the factory warranty.

In case of a possible warranty claim, contact your local supplier or FEBCO Representative. DO NOT REMOVE THE VALVE ASSEMBLY FROM THE PIPELINE.

8. The assembly must be protected from freezing and excessive pressure increases. Pressure increases can be caused by thermal expansion or water hammer. These excessive pressure situations must be eliminated to protect the valve and system from possible damage.

3. The valve assembly must be installed where it is accessible for periodic testing and

4. After servicing, repressurize the assembly and test to ensure proper operation.

5. Carefully inspect seals and seating surfaces for debris or damage.

6. After servicing, repressurize the assembly and test to ensure proper operation.

7. After servicing, repressurize the assembly and test to ensure proper operation.

8. After servicing, repressurize the assembly and test to ensure proper operation.

9. After servicing, repressurize the assembly and test to ensure proper operation.

10. After servicing, repressurize the assembly and test to ensure proper operation.

11. After servicing, repressurize the assembly and test to ensure proper operation.

12. After servicing, repressurize the assembly and test to ensure proper operation.

13. After servicing, repressurize the assembly and test to ensure proper operation.

14. After servicing, repressurize the assembly and test to ensure proper operation.

15. After servicing, repressurize the assembly and test to ensure proper operation.

16. After servicing, repressurize the assembly and test to ensure proper operation.

17. After servicing, repressurize the assembly and test to ensure proper operation.

18. After servicing, repressurize the assembly and test to ensure proper operation.

19. After servicing, repressurize the assembly and test to ensure proper operation.

20. After servicing, repressurize the assembly and test to ensure proper operation.

21. After servicing, repressurize the assembly and test to ensure proper operation.

22. After servicing, repressurize the assembly and test to ensure proper operation.

23. After servicing, repressurize the assembly and test to ensure proper operation.
